

RTOS Final Reflection

For this final project as a whole I found navigating learning all the hardest part to be getting all the elements to work together. Navigating GitHub and Pages on top of making the voiceover were new experiences for me. As it pertains to the App specifically the most difficult part was trying to name each task according to the theme. Also figuring out how to integrate and document an induced failure proposed an interesting challenge.

What I would do differently next time is taking more time to change the scaffold and experiment with different things. I would also build the circuit and stay away from the WOKWI Simulation. I find it much more engaging to build the physical circuit than run everything in a simulation that feels disconnected from real world experience.

The most valuable thing I learned is that Real time systems are everywhere in the real world and it's important and interesting to understand how they are used.
